## link.bin

Link.bin is the linker. It takes a top object .sob file and links it together with any child .sob files it requires, producing a .bin file.

Usage:

```
link filename [options]
```

Options:

- `/i` -- ignore out-of-date errors.
- `/v n` -- set verbosity to 0, 1, 2, or higher (default is 0). The higher the verbosity, the more messages link.bin prints as it runs.
